

INTEGRATED ERP SYSTEM – PROJECT REQUIREMENT BRIEF

1. Project Objective

We are looking to develop and implement a **single, integrated ERP platform for a coffee processing, curing, warehousing and distribution operation**, connecting the complete business journey from **vehicle/consignment entry at the gate through procurement, quality, inventory, processing, sales, logistics and finance**.

The core principle is “**One Consignment – One Digital Record.**” A consignment record should be created once at the gate and progressively updated by every department, eliminating duplicate data entry, paper-based handoffs and disconnected departmental systems.

2. Functional Scope

The proposed solution should cover the following **15 integrated modules**:

1. **Gate & Security** – Vehicle/driver registration, digital QR gate passes, entry/exit control and audit trail.
2. **Weighbridge** – Gross/tare weight capture, automatic net-weight calculation, weighbridge integration, variance alerts and digital slips.
3. **Quality & Laboratory** – Bag-wise sampling, moisture testing, quality analysis, grading, hold/release controls and quality certificates.
4. **Godown & Warehouse** – Lot/grade-based inventory, stack allocation, live stock, ageing, capacity, transfers, loading/unloading and stock counts.
5. **Procurement** – Supplier/planter/agent management, rate contracts, quality-linked pricing, advances, commissions and supplier performance.
6. **Curing Works** – Batch creation, processing stages, input/output reconciliation, outturn, by-products, process loss and productivity.
7. **Sales & Dispatch** – Buyer management, contracts, dispatch orders, load orders, invoicing and domestic distribution.
8. **Export Documentation** – Invoice, packing list, certificate of origin, Coffee Board/phytosanitary documentation, shipping documentation, LC tracking and document vault.
9. **Freight & Logistics** – Booking, container management, shipment milestones, cut-off alerts, freight costs and tracking.
10. **Finance** – Payables, receivables, purchase/sales accounting, costing, advances, GST/TDS data and Tally-ready exports.
11. **Management Dashboard** – Real-time visibility of operations, inventory, quality, contracts, shipments, cash flows, exceptions and approvals.
12. **Mobile Application** – Role-based mobile interfaces, QR scanning, camera/photo capture, offline data capture with synchronisation and alerts.
13. **Reports & Analytics** – Department-wise reports, dashboards, scheduled reports and Excel/PDF exports.

14. **Roles, Permissions & Audit** – Role/department/location-based access, approval limits and complete user/device/time-stamped audit trail.
15. **Cloud Document Storage** – Centralised storage and automatic organisation of photographs, certificates, invoices, contracts and other documents.

3. Key Workflow Requirement

The system must provide **end-to-end traceability of every consignment/lot**.

Inbound Flow

Vehicle Entry → QR Gate Pass → Gross Weighment → Quality Sampling/Clearance → Godown Allocation → Unloading → Detailed Quality Analysis → Tare Weighment → Net Weight → Purchase/Settlement

Outbound Flow

Dispatch Order → Vehicle Entry → Tare Weighment → Stock/Lot Selection → Quality Clearance → Loading → Loaded Weighment → Invoice & Documentation → Gate Exit → Freight/Shipment Tracking

Departments should receive relevant information **automatically and in real time**, rather than relying on physical documents or manual re-entry.

4. Technology & User Requirements

- Web-based application for office/management users.
- Mobile application for gate, weighbridge, quality, warehouse and management users.
- QR-based identification and transaction processing.
- Offline data capture with automatic synchronisation where connectivity is weak.
- Photo/document capture linked directly to the relevant consignment/lot.
- Integration capability with **weighbridge hardware and existing accounting system (Tally)**.
- Role-based access and approval workflows.
- Complete audit trail of all transactions and changes.
- Cloud-hosted architecture with secure, independently backed-up document storage.
- Notifications/alerts through application, email and/or WhatsApp where appropriate.

5. Management Dashboard

Management should have a single real-time dashboard covering:

Live Yard Status | Today's Inbound/Outbound | Stock by Lot & Grade | Ageing & Capacity | Quality Exceptions | Buyer Contracts & Fulfilment | Shipments | Cash/Payables/Receivables | Pending Approvals | Operational Exceptions

The dashboard should support drill-down from summary figures to the underlying transactions and generate automated daily/weekly management reports.

6. Expected Outcome

The implementation should deliver:

- One source of truth across all departments.
- Elimination of duplicate data entry and paper-based handoffs.
- Real-time inventory and consignment visibility.
- Complete lot/consignment traceability.
- Faster and more accurate procurement, sales and financial processing.
- Better quality and operational controls.
- Automated documentation and reporting.
- Strong role-based controls and auditability.
- Real-time management visibility and exception-based decision making.

7. Vendor Response Expected

Vendors are requested to provide a **technical and commercial proposal** covering:

- Proposed solution architecture and technology stack
- Functional approach and module coverage
- Mobile + web application approach
- Integration capabilities, particularly weighbridge and Tally
- Implementation methodology and estimated timeline
- Data migration approach
- Hosting, security, backup and disaster recovery
- Testing, training and go-live support
- Post-implementation AMC/support model
- Project team structure
- **Detailed module-wise and phase-wise commercial proposal**
- Key assumptions, exclusions and dependencies
- Relevant experience in ERP/industrial, manufacturing, warehouse, trading or similar operations
